# Your liver health

Liver disease is often called silent, because there are very few symptoms in the early stages. If liver disease is diagnosed before severe damage occurs, the liver has the capacity to regenerate itself.

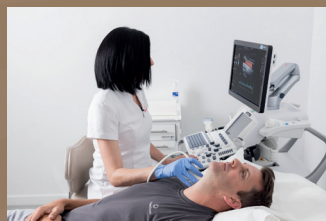

1 in 5 people in the UK are in the early stages of nonalcoholic fatty liver disease (NAFLD)

Medical Consultation

Blood tests

Ultrasound

LiverMultiScan MRI

OUR

## Liver health Assesment

We have introduced LiverMultiScan alongside our existing blood tests, ultrasound and MRI scans, as well as taking into account your medical and family history.

# What is LiverMultiScan?

LiverMultiScan is an advanced MRI scan providing detailed measures of inflammation, fibrosis, iron and fat. Alongside our blood tests, ultrasounds and detailed family and medical history consultations, our doctors can evaluate your liver health. Early diagnosis of liver disease often means that, with lifestyle changes and or medication the liver has the ability to regenerate itself.

## CASE STUDY

# Client diagnosed with early stage NAFLD

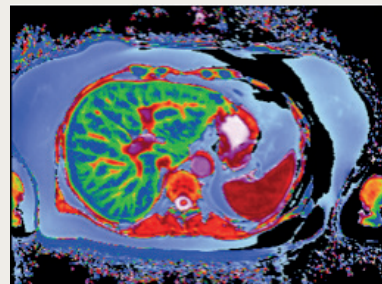

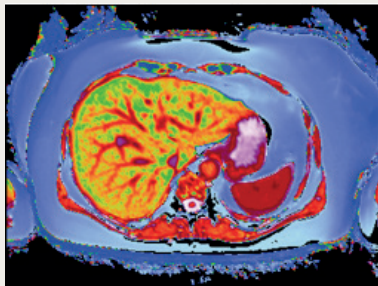

## LIVER HEALTH

57-year-old female, overweight, suffering from chronic fatigue syndrome and fibromyalgia. This client implemented our recommended lifestyle changes and saw a significant improvement in her liver and overall health.

### Initial diagnosis

Fibroinflammation (cT1): 878.4ms  
Reference range: 633-794ms

Fat (PDFF): 16.5%  
Normal range: < 5.6%

Fibroinflammation (cT1): 738.3ms  
Reference range: 633-794ms

Fat (PDFF): 2.4%  
Normal range: < 5.6%
